QUEUE ALGORITHM

- 01 Sort AssetArray by tier (T1→T4), then by ADV descending
- 02 Enqueue all assets into LiquidationQueue (FIFO)
- 03 While target > 0 and queue is not empty: dequeue()
- 04 Compute liquidation fee for each dequeued asset
- 05 Push sold asset into results Array and log the event
- 06 Report shortfall if queue exhausted before target met
